

TIP

Copy mimic to multiple relays with Exporting/Importing function for more efficient mimic creation.

Even though making a mimic in AQtivate-setting tool takes only a few minutes per relay making the same mimic by hand for tens of relays can add up to hours of work. To avoid doing unnecessary repetition the mimic you have once done can be exported into a separate .xml file with *Export As...* button (highlighted in the image above).

When opening the aqs-configuration file of another relay the previously exported .xml file can be imported with *Import from* button.
